

4. Plant Pathology

Disease Scenario

During 2019-20, moderate to severe occurrence of Alternaria blight was recorded at all locations. However, low to the medium severity of Alternaria blight was recorded from JAG and MOR. White rust appeared in moderate to severe form at all locations except JAG. Medium to severe prevalence of DM was observed at the cotyledonary stage at JHS and PNT. Powdery mildew severity was moderate to high at JHS, SKN, MOR and low at JAG and BPR. Low to moderate incidence of Sclerotinia rot was observed at MOR, HSR, SGN, and PNT. Different trials were on dates as given below:

Centre	Date of sowing of different trials						
	4.1	4.2	4.3	4.4	4.5	4.6	4.9

4.1. Screening of *Brassica* germplasm and breeding materials

Natural conditions: DOL, SHL, NDH, HSR, JHS, MOR, PNT, SGN, JAG, LDH, and VAR.

Artificial conditions: **AB**: DOL, SHL, PNT, HSR, LDH, and JHS; **WR**: PNT, JHS, HSR and LDH; **DM**: JHS, PNT; **SR**: LDH, HSR, MOR, PNT and BPR.

25 breeding lines with 8 checks were sown in single 3-m row in randomized completely block design (RCBD) with 2 replications. Susceptible checks were used after every two test rows. Under artificial conditions, repeated inoculation was done after collecting inoculum from naturally infected plants for AB to facilitate the secondary spread. For screening against WR and DM, the oosporic material of local isolate was added with seed after grinding hypertrophied plant material collected from the previous year's crop as per standard procedure.

Observations on Alternaria blight on leaves (ABL), WR, DM, PM and SR were recorded at 75 and/or 90-100 days after sowing (DAS). Number of staghead and Alternaria pod blight (ABP) severity/incidence were recorded 15 days before harvest. The results are given in Table 4.1.1-6. Data of VAR were not as per the technical programme, therefore, excluded from mean of locations. All disease data recorded in per cent were depicted as arc sin transformation value.

AB: None of the entries showed tolerance to Alternaria blight.

WR: Under natural condition PDZ 11, PDZ 12 (Bj) and AKMS 8141, AKGS 8146, AKGS 8217, GSH 1717, GSH 1699 (Bn) were found resistant at all eight locations (Table 4.1.3). Under artificial condition PDZ 12, PDZ 11 (Bj), and AKGS 8217, HNS 1102, GSH 1699, AKMS 1841, AKGS 8146, GSH 1717, (Bn) were found resistant to WR at all locations except JHS (Table 4.1.6).

DM: RH (OE) 1706 of *B. juncea* and GSH 1717 of *B. napus* showed resistance to DM at PNT and JHS.

PM: None of the entries of *B. juncea* were tolerant at JHS, SKN, JAG, MOR and SGN.

SR: None of the entries were found tolerant to SR under natural/ artificial condition at all locations.

4.2. Uniform Disease Nursery for major diseases

Locations: SHL, MOR, DOL, NDH, PNT, HSR, JAG, LDH, VAR, JHS and SGN.

Total 49 entries, including 8 checks, were sown in a single 3-m row with two replications in RCBD. Susceptible checks were sown after every two test rows. Observations on AB, WR, DM, SR and PM were recorded under natural infection conditions (Tables 4.2.1-3).

WR: DRMRSJ-1, DRMRSJ-7, DRMR 2018-37, and PAB 14-5 of *B. juncea* showed resistance reaction to WR under natural conditions with mean disease severity <10%, whereas highest WR severity was on check Rohini was 31.5%.

SR: DRMRSJ 25 at MOR and PNT while, RMM-10-1-1, DRMRSJ 26 and DRMR 2018-41 were found tolerant at MOR and SGN to SR under natural condition.

4.3 National Disease Nursery (NDN) for Alternaria blight

Locations: PNT, DOL, HSR, LDH, MOR, VAR and SHL.

Total 39 strains including 4 check were sown in paired rows of 3 m length. Observation on AB was recorded on leaves 75, 100 DAS at silique formation stage and 15 days before harvesting under artificial inoculation conditions. Reaction to WR, DM, SR and PM was also recorded under natural conditions (Table 4.3.1-3).

PMW 8, DRMR-2018-37, DRMR 2018-41, DRMRSJ-7, PAB 14-5, DRMRSJ-1, DRMRSJ-4, DRMRDJ-3, DRMRDJ-1, and DRMRSJ-19 of *B. juncea* showed resistant reaction to WR.

4.4 National Disease Nursery (NDN) for white rust

Locations: PNT, MOR, SHL, HSR (natural condition); LDH, NBPG (artificial condition)

Total 93 genotypes, including 10 checks, were sown in paired-row of 3 m length between susceptible check. Observation for WR on leaves and staghead formation was recorded at 75, 100 DAS under artificial inoculation conditions. Reaction to AB, SR, DM and PM was also recorded under natural conditions (Table 4.4.1-2).

PRD 17-1, PRD 17-2, DRMRIJ 12-40, DRMRIJ-16-7-1, RH 1400, RH 1400-1, entries of *B. juncea* showed immune reaction to WR at MOR, PNT, HSR locations. Some of the promising strains sowing resistance to WR were DRMRIJ 12-27, DRMRIJ 12-37, DRMR-5206, PDZ 5, DRMRSJ-1, DRMRSJ-4, DRMR 2018-41, DRMRDJ-1, DRMR 2018-37 and DRMRIJ 12-37 (3 locations).

PB (A4A5)-842, PJK (A4A5)-21, Varuna (A4A5)-936-279 were showed immune reaction to WR at 5 locations and also at cotyledonary stage under artificial conditions. Although, PB(A4A5)-491 showed resistant reaction to WR at 3 locations (Table 4.4.3).

DRMRIJ 12-26, and DRMRMJA-35 were found consistently resistant to WR during 2014-15, 2015-16, 2016-17, 2017-18, 2018-19 and 2019-20.

PM: None of the entries of *B. juncea* showed resistance to PM at MOR.

4.5 National Disease Nursery (NDN) for Sclerotinia rot

Locations: PNT, HSR, LDH, BPR, VAR and SHL

Total 20 strains including 3 checks were sown in paired rows of 3 m length between susceptible check (Rohini, RL 1359) and NRCYS-5-2. Stem inoculation was done to ensure SR infection. Sclerotinia rot was recorded prior to harvest. In addition, reaction to AB, WR, DM and PM was also recorded (Table 4.5.1-2).

DRMRSJ 21, DRMRSJ-22 and DRMR 5206 showed promising reaction to SR with small lesion size and <50% incidence under artificial conditions consistently second year.

4.6 Screening of IVT entries of Brassica against different diseases

Locations: MOR, DOL, SHL, PNT, HSR, LDH, SGN and JAG

Total 126 strains including 8 checks were sown in single 3m row in RCBD with 2 replications. Susceptible check(s) were used after every 2 test rows. Susceptible variety 'Rohini' was used as filler. Observations on Alternaria blight on leaves, WR, DM, PM, SR and BR were recorded at 75 and 100 DAS. Number of staghead and Alternaria pod blight incidence was recorded 15 days before harvesting. Entries showing resistance/ tolerance to AB, WR, DM, PM and SR under natural conditions are listed in Table 4.6.1-2).

WR: MCB 1-2-3-2-4, PDZ 13, 91J5001 (Q), 7J157C (H) of *B. juncea* were found resistant and DRMR 2018-25 and JC 33 were also found promising to WR at five locations. While, almost all the entries of *B. rapa* var. Toria and *B. rapa* var Yellow Sarson, *B. napus* escaped WR infection.

4.7 Standardization of differential hosts for identification of races in *A. candida*

The reaction of 10 rapeseed-mustard genotypes was recorded against 4 isolates of *Albugo candida* (PNT, HSR, BPR, NDH, LDH) at LDH, HSR, PNT and NBPGR. Noe of the genotype gave resistant reaction against all 4 isolate. Genotype DRMRAB-753 gave susceptible reaction to all isolates at all five locations. While, genotypes DRMR 2035, Basanti gave resistant reaction against Ac-BPR, and Ac-HSR, while variable reaction to other isolates of *A. candida* at 3 locations (Table 4.7.1-2). Short of consistent results concluding findings under this experiment is lacking.

4.8 Epidemiology of Alternaria blight, white rust, powdery and downy mildew

Experiments on the epidemiology of foliar diseases of rapeseed-mustard were laid out using cv. Varuna and local variety was sown on eight different dates at the weekly interval starting from October 01 to November 19 without adopting any protection measures against pest and diseases at PNT, SHL, SKN, MOR, JAG, DOL (Table 4.8.1-6).

PNT

Two genotypes Varuna and Kranti were taken for eight different sowing dates. Downy mildew disease first appeared 10 DAS on Nov 05, Nov 12, and 11 DAS on Oct 29 and Nov 19 sown Varuna and Kranti cultivars. Whereas, on Oct 01 to Oct 22 sown crop the DM appeared between 35 to 42 DAS and on Oct 29 to Nov 19 sown

crop disease appeared between 56 to 70 DAS on both the cultivars. White rust disease first appeared 38 DAS on Nov 12 and Nov 19 sown crop while 50 DAS on Oct 1, and Oct 08, continued up to 97 DAS on late sown crop (Table 4.8.1). Alternaria blight disease was first noticed 39 DAS on Oct 08 and 46 DAS on Oct 01, and Nov 05 on both the cultivars. While, on Oct 22 sown crop, the disease appeared late i.e. 56 DAS. The Alternaria blight on pods first appeared 88 DAS on late (Nov 12) sown crop which is 7 days early in comparison to last year. On early (Oct 01) sown crop, the symptoms on pod appeared late after 120 days of sowing (Table 4.8.2).

SHL

Epidemiological experiment was laid out with cv. Varuna and TM 2. The crop was sown with 6 dates of sowing started from Oct 15 to Nov. 19 at weekly intervals. AB was first observed at 41 DAS in Nov 05 sown crop. While AB appeared at 66 DAS in Oct 08 seeded crop during 2018-19, while, it was appeared in 39 DAS in Nov 19 sown crop during 2017-18. AB on siliques first appeared at 85 DAS in Nov 19 sown crop which was appeared at 110 DAS in early sown crop on Oct 15 in both the cultivars. Maximum disease severity was at 100 DAS (39.2%) in Nov 19 on cv TM 2 (Table 4.8). Maximum yield was recorded in Oct 29 sown cv Varuna (17.2 q/ha) while in TM 2 it was 12.9 q/ha (Oct 29). Yield data revealed that the best sowing time of crop in the region is last week of October (Table 4.8.3).

SKN

Experiment was laid out with cv. Varuna and GM 2 sown on 8 dates of sowing started from Oct 01 to Nov. 19 at weekly intervals. Powdery mildew disease first appeared at 78 DAS instead of 83 DAS, 76 DAS during 2018-19, 2017-18 respectively, on Nov 19 sown crop of Varuna and 79 DAS instead of 88 DAS last year in Nov 19 sown GM 2. The maximum disease severity was observed 99% in Nov 19 on Varuna followed 97% in Nov 12 sown GM 2. The maximum seed yield reduction was observed in late sown crop. Although, highest yield was observed in Oct 01 sown crop (Table 4.8.4).

MOR

Trial on epidemiology of foliar diseases of Indian mustard was laid out with cv. Varuna and Rohini. The crop was sown with 8 dates of sowing started from Oct 01 to Nov. 19 at weekly intervals using recommended agronomic practices. Alternaria blight on leaf was first appeared 70 DAS in Nov 12, and Nov 19 sown both Varuna and Rohini. Whereas, AB on siliques appeared at 80 DAS on same plots (4.8.5). PM was observed first 80 DAS and was maximum 63.1 % reported in cv Varuna at 130 DAS in Nov 19 sown crop (Table 4.8.5).

WR was appeared first on 48 DAS in Nov 19 and appeared till 110 DAS in Oct 01 sown crop. WR disease severity was maximum upto 44.0% in Nov 05 sown crop both in Varuna and Rohini. Maximum staghead was observed 44.4% in Nov 19 sown Rohini followed by Nov 05 sown both cultivars. Maximum yield (26.5 q/ha) was recorded in Oct 08 sown both cultivars (Table 4.8.6).

JAG

Experiments on epidemiological studies of PM and WR was laid out with cvs. Varua and DRMRIJ 31 with 8 dates of sowing started from 01 Oct to Nov 19 at weekly interval using recommended agronomic practices. PM was appeared first at 66 DAS on Varuna while at 70 DAS on DRMRIJ 31 in Nov 19 sown. WR first appaeared at 48 DAS on DRMRIJ 31 sown on Nov 19. Optimum date of sowing for maximum seed yield seems between Oct 08 to Oct 15 sown crop (Table 4.8.7).

DOL

Experiment was laid out with cv. Varuna and Rajendra Suflam sown with 8 dates of sowing started from Oct 01 to Nov 19 at weekly intervals. AB was first observed at 41 DAS in Nov 19 sown on Varuna and 50 DAS on

Rajendra Suflam, while appeared late in early sown Oct 01 sown crop (90 DAS). The disease continued to progress on leaves up to 140 DAS on both the cultivars (Table 4.8.8).

4.9 Testing of IDM module for major rapeseed-mustard diseases

Locations: BPR, LDH, DOL, JAG, MOR, PNT, SHL, and SGN

The experiment was conducted in plot size 15x7m with 45x20 cm spacing in three replications. Variety DRMRIJ 31 was sown between 10-20 Oct using recommended fertilizer doses (80:40:40). After 100-days of sowing, 20 plants from each replication showing disease symptoms were tagged for observation and yield was assessed.

AB, WR, DM, PM, SR diseases were observed in the integrated disease management practices and farmer's practices to standardise the best integrated disease management module. Module includes seed treatment with *Trichoderma harzianum* @10g/ kg seed, soil application of *Trichoderma* (1 kg/ 50 kg FYM), basal application of zinc sulphate @ 15 kg/ h + S (dose as per location recommendation) + boron (10 kg borax/ ha), line sowing 45 x 20 cm spacing, no irrigation during 25th to 15th Jan. AB severity recorded from 18.2 % at MOR to 40.2% at PNT in module while in farmer's practices AB severity ranged from minimum 21.2% at JAG to highest at PNT (46.9%). Similarly, WR severity was recorded minimum 6.3 % at DOL and maximum 36.2 % at PNT in module while minimum at DOL (10.0%) and maximum 60.0% at BPR in farmer's practices. PM severity was observed in module between 19.3 % at Jag to 73.0% at SKN while in farmer's practices 15.9% at Jag to 75.5% at SKN. Mean SR disease was reduced from 23.3% in farmer's practices to 12.2% in module. Our results showed that the significant increase in yield upto 2034 kg/ha by using IDM module over 1650kg/ha in farmer's practices (Table 4.9.1-2).

Survey of farmer's field for disease outbreak

HSR

Survey was conducted for the appearance and severity of diseases in Indian mustard in major mustard growing areas of Haryana state. The first appearance of white rust disease was noticed during first week of January at farmer's field. The incidence of all the diseases remained quite low due to the prolonged cold climate throughout growing season. White rust disease severity ranged between 0-10 per cent at farmer's field, however up to 10-15 per cent white rust severity was noticed at some of the locations in district namely Hisar, Dadri, Bhiwani and Mahendragarh. However, incidence of Sclerotinia rot was noticed low in throughout state ranging between 2-4 per cent. Alternaria blight also remained low as disease severity recorded 0-5 per cent throughout the state. Bacteria stalk rot was noticed at some locations after first irrigation in low lying areas in mustard growing areas in state. Powdery mildew disease appeared in low intensity even in late sown conditions in Haryana.

MOR

Survey was conducted in adjoining areas of Morena district of MP to observe rapeseed-mustard diseases. AB first appeared on Dec. 24, WR on Nov. 30, staghead on Dec. 28, PM on Feb. 18 and Sclerotinia rot was first seen on Jan. 5 at farmer's field. Weather conditions were not much favorable to diseases at early stage of the crop but in month of Dec., Jan., Feb. and March, when winter rains came, all foliar diseases increased sharply. The staghead and Powdery mildew disease were observed in most of the fields which were sown late.

SHL

Survey was conducted on farmer's field in Nagaon, Morigaon and Nalbari districts of Assam. Alternaria leaf blight appeared/observed from the second fortnight of December'2019. During the crop season, the disease severity ranged from 4.7 to 39.5 % at the farmer's field. Sclerotinia rot was observed in the first week of January, 2020. The disease incidence was ranged from 2.5 to 4.7 %.

PNT

Downy mildew disease first appeared at cotyledonary stage on Oct 27, 2019, WR appeared on Nov 20, 2019 and AB disease on leaves was observed on Nov. 15, 2019 while on pod AB was appeared on Feb. 01, 2020. Sclerotinia rot was initially observed on Jan 12, 2020. The first appearance of bacterial blight disease was observed on Dec. 24, 2019. The weather condition was highly favorable to WR, AB and SR diseases. The WR disease was highly severe between Jan 20-25, 2020, while AB during Feb. 25-30, 2020. The staghead infestation was very high and observed in many plants. The SR was more severe during Feb. 15-20 2020.

DOL

Disease survey was conducted in West Champaran (Harinagar, Narkatiaganj), Sitamadhi (Riga), Sheohar, Gopalganj, Samastipur (Hasanpur), Darbhanga (Jale), Saran (Pahleja), Muzaffarpur and Vaishali districts of Bihar to observe the diseases of rapeseed-mustard. Higest AB severity (76.0%) was observed from TCA, Dholi Farm while lowest Ab severity (23.0%) was observed from Saran district. Altough, SR incidence was higest (25.0%) in Vaishali and lowest (6.0%) in Gopalganj. The mean WR severity was less than 10% in Samastipur, Saran (Pahleja), Muzaffarpur and Vaishali districts.

JAG

A survey was conducted to observe severity of diseases of Indian mustard at different locations of south Chhattisgarh (Plateau of Bastar). AB appeared in the fourth week of February and disease severity was ranged between 0-35%. While, PM appeared in the first week of February and disease severity was 15-70% just after 10 days of rainfall. While, WR disease was appeared during second week of January with 0-15% disease severity.

SKN

Survey of four farmer's field for disease outbreak was conducted. Powdery mildew was observed in severe form on late sown crops. In timely sown crop, powdery mildew disease severity was observed between 10-20 per cent and white rust disease intensity between 20-40 per cent.
